# Data Modelling

## One to Many

# Model Design

# Model Design

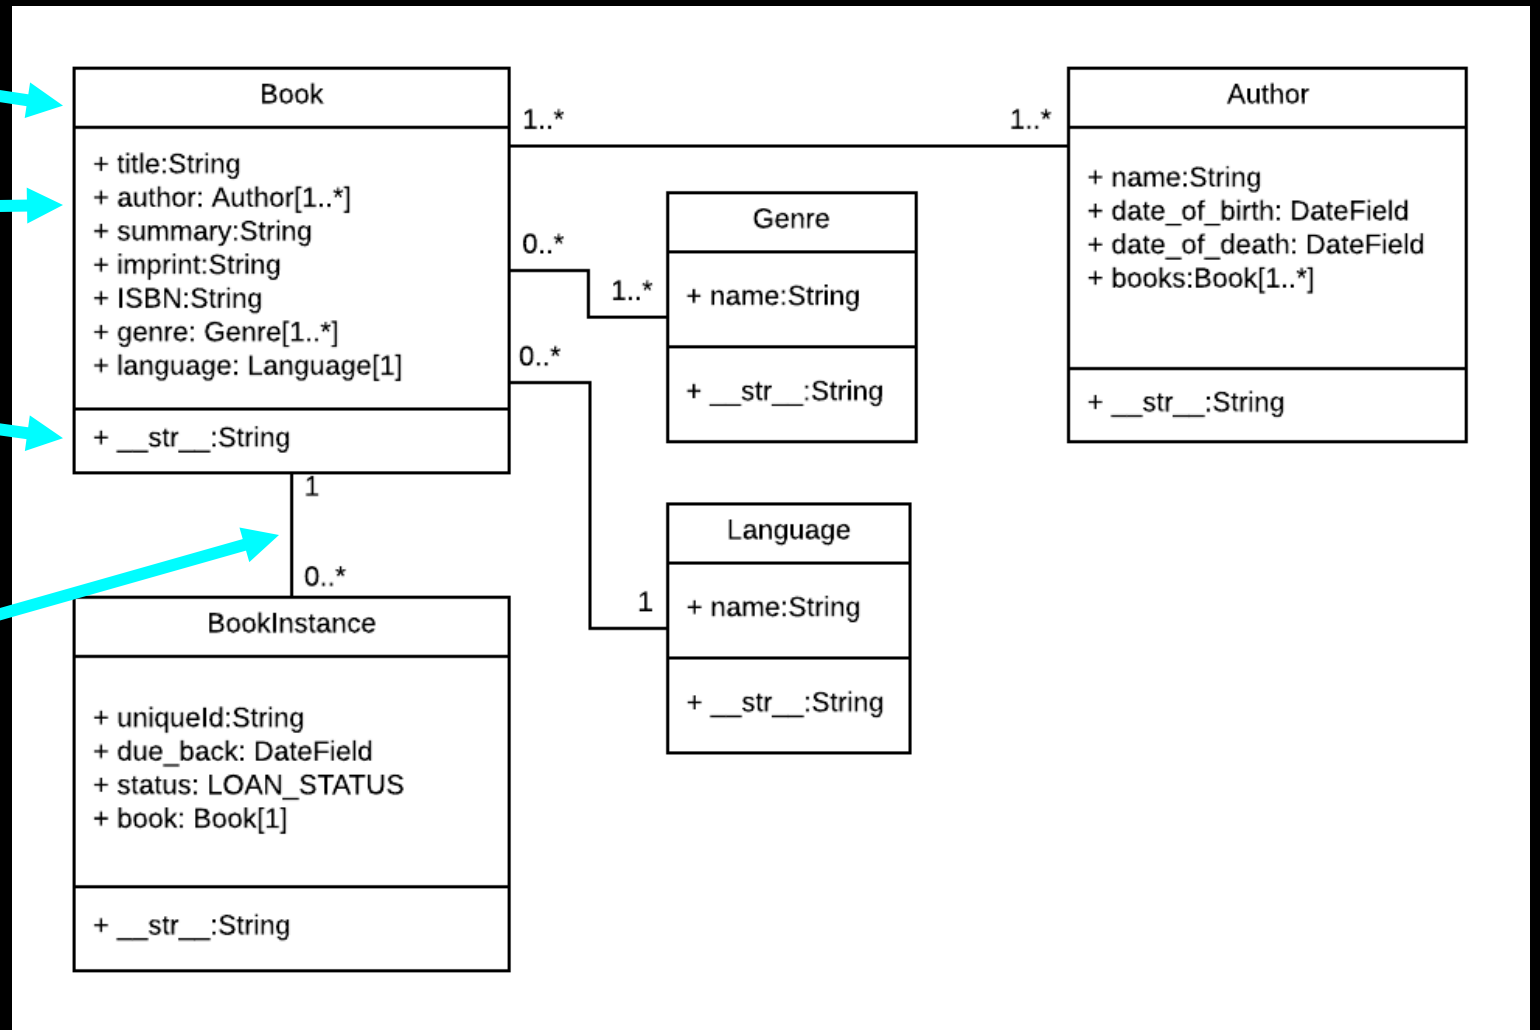

- Model design is an **art form** of its own with particular skills and experience
- Our goal is to avoid the really bad mistakes and design clean and easily understood models
- Model design starts with a sample data set and draws a picture

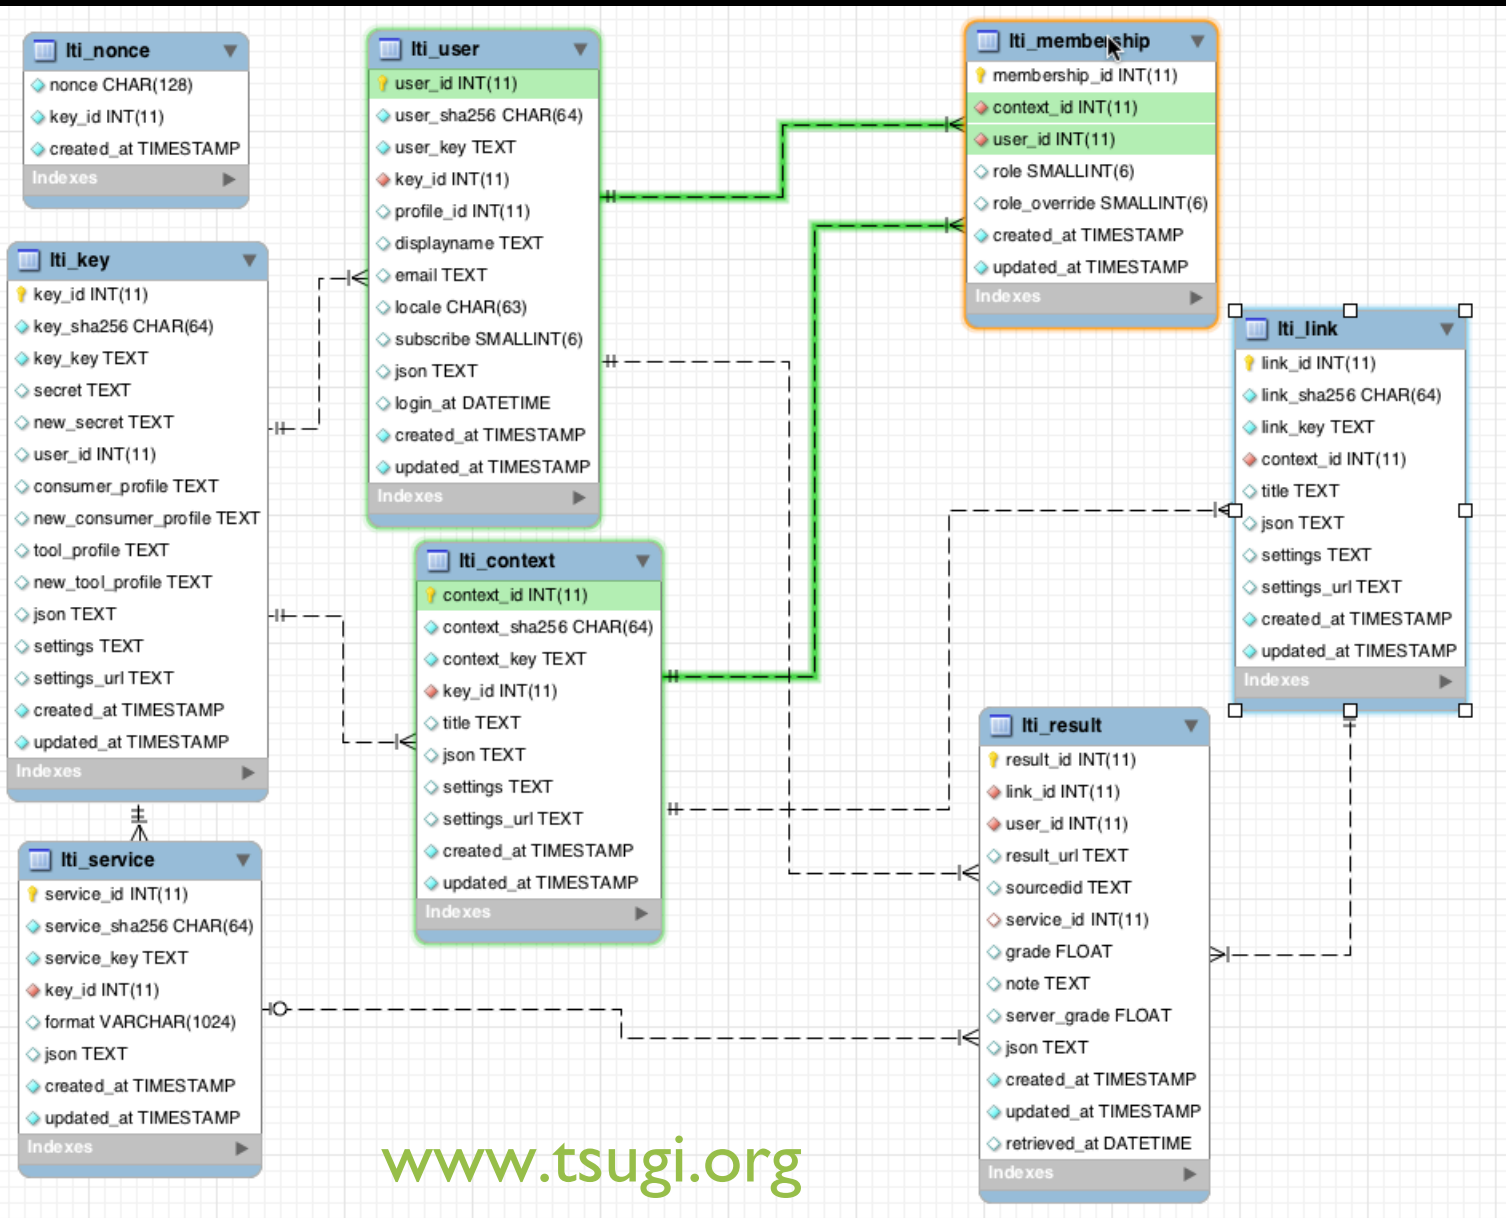

Table

Field

Method

"One Book can have  
between zero and infinite  
number of BookInstances"

# Database Normalization (3NF)

- There is \*tons\* of database theory / math – we simplify this to a few rules...
- **Do not replicate data** - reference data - point at data
- Add a special “**unique key**” column to each table which we will make references to. By convention, many programmers and frameworks call this column “**id**”
- Use **integers** for to make links between tables – integers are fast and small

[http://en.wikipedia.org/wiki/Database\\_normalization](http://en.wikipedia.org/wiki/Database_normalization)

# Key Terminology

- We add an *automatically incrementing* column to every row which we call the "**Primary Key**" for that row. We often name the column "**id**" to indicate that it is the "identifier" for that row.
- When we add a column to a table that "points to" a row in another table we call it a "**Foreign Key**" and often include the name of the destination table in the column name like "**lang\_id**"

```

from django.db import models

class Lang(models.Model):
    name = models.CharField(max_length=200)

class Book(models.Model):
    title = models.CharField(max_length=200)
    isbn = models.CharField(max_length=13)
    lang = models.ForeignKey('Lang', on_delete=models.SET_NULL, null=True)

class Instance(models.Model):
    book = models.ForeignKey('Book', on_delete=models.CASCADE)
    due_back = models.DateField(null=True, blank=True)
  
```

```

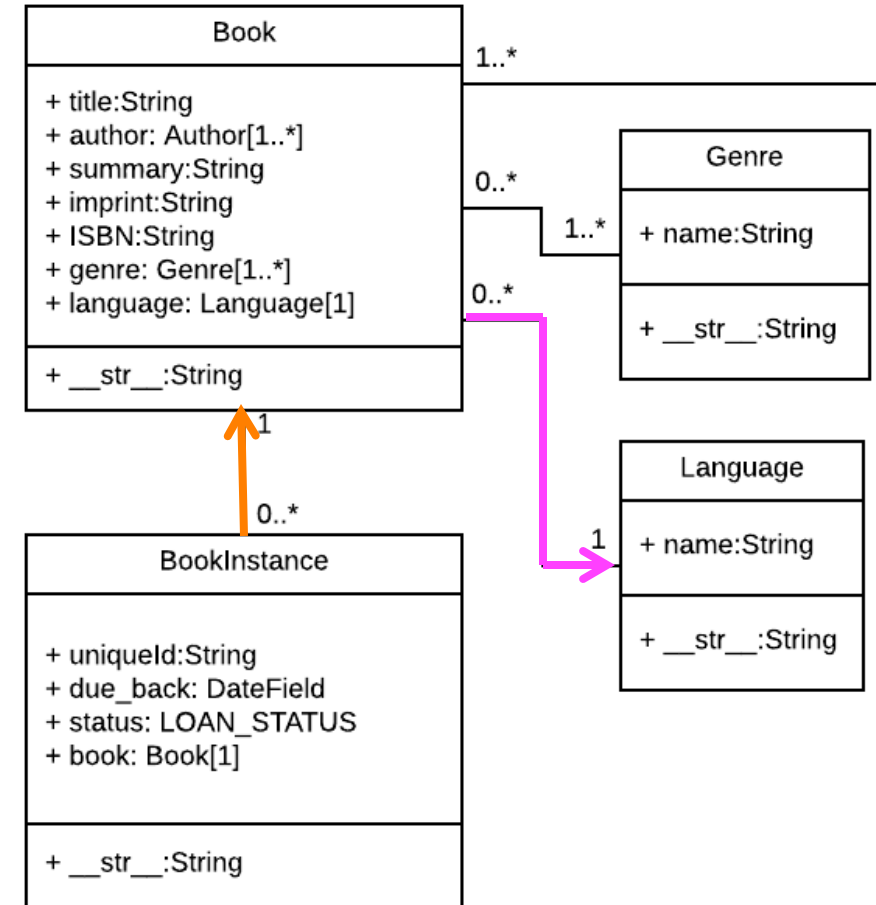

from django.db import models

class Lang(models.Model):
    name = models.CharField(max_length=200)

class Book(models.Model):
    title = models.CharField(max_length=200)
    isbn = models.CharField(max_length=13)
    lang = models.ForeignKey('Lang',
                             on_delete=models.SET_NULL, null=True)

class Instance(models.Model):
    due_back = models.DateField(null=True, blank=True)
    book = models.ForeignKey('Book',
                             on_delete=models.CASCADE)

```

<https://github.com/csev/dj4e-samples/blob/master/bookone/models.py>

# From Model to Database

```
$ python3 manage.py makemigrations
```

```
Migrations for 'bookone':
```

```
bookone/migrations/0001_initial.py
```

- Create model Book
- Create model Instance
- Create model Lang
- Add field lang to book

```
$ python3 manage.py migrate
```

```
Operations to perform:
```

```
Apply all migrations: admin,...
```

```
Running migrations:
```

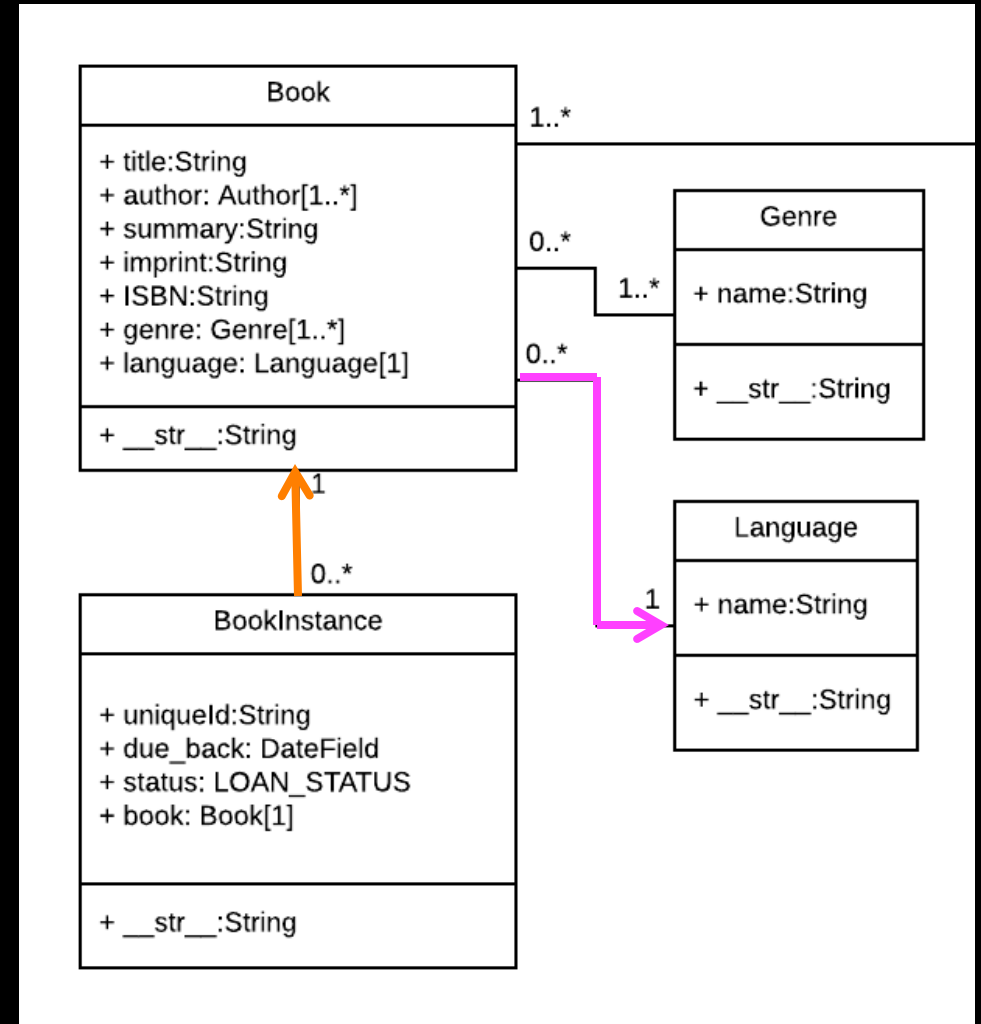

```
Applying bookone.0001_initial... OK
```

Note that makemigrations only "does something" when you create or alter a models.py file. The migrate only "does something" when there are migrations that are not yet applied to the database. Also an application must be added to settings.py before these commands see the models.py file for an application.

```

# About on\_delete

- What do we do when a row in one table points to a row in a "foreign" table via a foreign key and the "destination row" is deleted
  - on\_delete = set\_null – Keep the row but set foreign key to null
  - on\_delete = cascade - Delete the row

# Demo Batch Loading from CSV

<https://github.com/csev/dj4e-samples/tree/master/samples/scripts>

<https://django-extensions.readthedocs.io/en/latest/runscript.html>

# Loading Data From A File

- Sometimes we need to pre-load data into our Django database
- This data might come from an API or file
- We need to write a Python program to function like the Django shell

`cats/meow.csv`

```
Name,Breed,Weight  
Abby,Sphinx,6.4  
Annie,Burmese,7.6  
Ash,Manx,7.8  
Athena,Manx,8.9
```

<https://github.com/csev/dj4e-samples>

# Installing django-extensions

```
dj4e-samples$ pip3 install django-extensions
Requirement already satisfied: django-extensions in
/Library/Frameworks/Python.framework/Versions/3.6/lib/python3.6/site-packages
Requirement already satisfied: six>=1.2 in
/Library/Frameworks/Python.framework/Versions/3.6/lib/python3.6/site-packages
dj4e-samples$
```

Note that this is installed already in dj4e-samples but for a new project you will need to install it yourself and edit **settings.py**

<https://django-extensions.readthedocs.io/en/latest/runscript.html>

# Include Extensions in Project Settings

[dj4e-samples/settings.py](#)

```
INSTALLED_APPS = [  
    'django.contrib.admin',  
    'django.contrib.auth',  
  
    [ ... ]  
  
    # Extensions - see requirements.txt  
    'django_extensions',  
    'crispy_forms',  
  
    [ ... ]  
  
    'home.apps.HomeConfig',  
  
    # Sample Applications - don't copy  
    'hello.apps.HelloConfig',  
    'getpost.apps.GetpostConfig',  
    'users.apps.UsersConfig',  
  
    [ ... ]  
]
```

# Make a scripts folder

```
dj4e-samples$ mkdir scripts  
dj4e-samples$ touch scripts/__init__.py
```

We place empty `__init__.py` files in folders to indicate to Python that they contain files that hold modules and as such are suitable for importing into a Python application.

<http://effbot.org/pyfaq/what-is-init-py-used-for.htm>

# The Data File

```
dj4e-samples$ cat cats/meow.csv
```

```
Name,Breed,Weight
```

```
Abby,Sphinx,6.4
```

```
Annie,Burmese,7.6
```

```
Ash,Manx,7.8
```

```
Athena,Manx,8.9
```

```
dj4e-samples$
```

[https://en.wikipedia.org/wiki/Cat\\_\(Unix\)](https://en.wikipedia.org/wiki/Cat_(Unix))

## scripts/cats\_load.py

```
import csv
from cats.models import Cat, Breed

def run():
    fhand = open('cats/meow.csv')
    reader = csv.reader(fhand)
    next(reader) # Advance past the header
